This heptapeptide is derived from RNA polymerase II carboxy-terminus

(Pol II CTD) and is a variation of the consensus motif in AAW18356. At least two heptapeptide repeats form a peptide conjugate with a linker and a bioactive molecule. The peptide conjugate can then be used to deliver the bioactive compound, such as a protein, peptide, sugar or nucleic acid sequence (e.g. a ribozyme, external guide sequence for nucleoside, nucleotide, gene, cDNA, mRNA or RNA) to the nucleotide, nucleoside, qene, cDNA, mRNA or RNA) to the nucleus of a nucleoside, nucleotide, gene, cDNA, mRNA or RNA) to the nucleus of a cell. Phosphorylating the peptide alters its association with certain molecules in the nucleus, such as proteins having a serine/arginine molecules in the nuclear ribonucleoprotein (5m snRNP) e.g. phosphorylated Pol II CTD (COOH terminal domain) derived peptides bind to nuclear proteins associated with transcription and splicing. Also, for delivery of molecules which are desired or not desired to be in close association with RNA, it may be desirable to phosphorylate or leave the ე Peptide conjugate for delivery of bioactive compounds to cell nucleus - comprises targetting molecule derived from RNA polymerase II carboxy-terminus and the bioactive molecule peptide unphosphorylated, respectively. New scaffold protein, useful for stabilizing antigens used as vaccines

Sequences AAY40791-Y40799 are examples of amino acid loops that can be used to connect beta strands S1 (AAY40602) and S2 (AAY40603). S1 and S2 are examples of beta strand peptides which form part of a scaffold Disclosure; Page 6; 105pp; English.

protein. Peptides (AAY40601-Y40609) together form a single-chain scaffold protein which contains at least 1 disulfide bond, contains less than 10% alpha helix and contains at least 6 beta-strands. The scaffold protein is constructed of beta strands S1-S6, and may also include beta strands form two beta sheets S1/S4/S3 and S6/S5/S2 with each strand connected to the next by hydrogen bonds, which generate a beta sandwich architecture. If the additional beta strands A1-A3 are included in the structure the scaffold is constructed of two beta sheets, with the structure scaffold is constructed of two beta sheets, with the structure the scaffold is constructed of two beta sheets, with the structure all/S1/S4/S3 and S6/S5/S2/A2/A3. The beta strands are connected to each other via amino acid loops, where at least one of the structures blids to a receptor or antigen. The scaffold may be totheir such as receptors. Or their constraince of the scaffold may be bound to a protein which binds to a tumour antigen. This will target the complex to tumour cells. Another surface may be bound to a cytotoxic molecule or an autoimmune antibody which may then kill the tumour cells. Therefore the scaffold protein may be used to target chemotherapeutic agents to specific cells. It may be used to target chemotherapeutic agents to specific cells. It may be used to target chemotherapeutic agents to specific cells. It may be used in diagnostic techniques, and to stabilize antigens used as ö Bacillus thuringiensis; delta-endotoxin; insecticide; crystal protein; lepidopteran insect; CrylC; genetic engineering; mutagenesis; mutant; caterpillar; beetle; mosquito; toxic; modification.                                                                     spray which is toxic to caterpillars, beetles and mosquitoes. The polypeptide of the composition may be used to kill an insect through ingestion of the composition directly or by ingestion of a plant coated with the composition or a transgenic plant that expresses the polypeptide composition. The insecticidal proteins produced by B. thuringiensis are specific target insect. The polypeptides have improved toxicity so a reduced amount of bioinsecticide per unit area of treated crop can be used allowing economic and efficient utilization in the field. The present sequence represents a B. thuringiensis CrylC crystal protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a new composition comprising an isolated polypeptide for modified Bacillus thuringiensis crystal proteins (CrylC). The polypeptide of the composition is insecticidally-active against Lepidopterans. The composition is toxic to an insect cell and comprised within an insecticidal formulation can be used as a plant protective spray which is toxic to caterpillars, beetles and mosquitoes. The polypeptide of the composition may be used to kill an insect through ingestion of the composition directly or by ingestion of a plant coated with the composition at ransgenic plant that expresses the polypeptide
modified Bacillus thuringiensis crystal proteins (Cry1C).
             The polypeptide of the composition is insecticidally-active against Lepidopterans. The composition is toxic to an insect cell and comprised within an insecticidal formulation can be used as a plant protective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bacillus thuringiensis; delta-endotoxin; insecticide; crystal protein;

ö
composition. The insecticidal proteins produced by B. thuringiensis are harmless to plants and other non-targeted organisms but toxic to their specific target insect. The polypeptides have improved toxicity so a reduced amount of bioinsecticide per unit area of treated crop can be used allowing economic and efficient utilization in the field. The
                                                                                                                                                                                                                                  Gaps
                                                                                               present sequence represents a peptide from the present invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Roberts GW, Heal JR; WPI; 2001-381629/40. A set of peptide ligands for agricultural research and development of therapeutic agents comprise specific complementary peptides to proteins encoded by genes of plant genomes

Example 4; Page 48; 201pp; English

The present invention relates to a set of peptide ligands consisting of

8

δ g

```
Human, fibrinogengamma, tissue targeting, ionising radiation, GPIIb, platelet membrane glycoprotein IIb; platelet membrane glycoprotein IIIa; IIIa; platelet activation; tumour; cancer.

The present invention relates to a method for targeting a tissue in a vertebrate for delivery of an active agent. The method comprises exposing the tissue to ionising radiation before, after and/or during administration of a delivery vehicle comprising the active agent. The ionising radiation targets the delivery vehicle to the tissue. The carboxyl-terminal segment of the gamma chain of human fibrinogen (see ABB37480) can be used as a delivery vehicle in the present invention. Human fibrinogengamma peptide binds to platelet membrane glycoprotein III (IIIa) following platelet activation, and can be used for site-specific localisation to irradiated tumours. The methods of the present invention may be used for irradiated tumours. The methods of the present invention may be used for cargeting therapeutic agents and imaging agents to target tissues. Cargeting theoplasms, e.g. benign intracranial melanomas, arteriovenous maccination and can entity and the activation and can be used to active the active tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               malignant glioma, prostatic carcinoma, kidney carcinoma, bladder carcinoma, pancreatic carcinoma, thyroid carcinoma, lung carcinoma, colon carcinoma, rectal carcinoma, solid tumours, solid tumour metastases, angiofibromas, retrolental fibroplasia, haemangiomas and/or Kaposi's sarcomas. The present sequence is a peptide linker. This sequence was used as a control peptide in assays for determining the effects of the carboxyl-terminal segment of the gamma chain of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
characterised by expression of a human cancer associated antigen (CAA) precursor (I) coded by a NA Group 1 nucleic acid molecule (NI) comprising contacting the biological sample with an agent (A) that specifically binds to NI, (I) or its fragment, complexed with an human leukocyte antigen (HLA) molecule and determining the interaction between the agent and NI or (I), (I) has cytostatic activity and can be used in gene therapy and vaccine production. The method can be used for treating a subject with a condition characterised by expression of (I) in cells of a subject AAB75607 and AAB75608 represent proteins from human cancer associated antigen precursors, and AAB75609 to AAB75802 represent HLA class I binding motifs in human cancer associated antigen precursors and precursors given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pentapeptide ligand; drug design; high throughput screening; HTS; MQSAR; Multivariate Quantitative Structure Activity relationships.
                                                                                                                                                                                                                                                   Diagnosing a disorder characterized by expression of a human cancer associated antigen precursor, comprises detecting interaction of an agent with a nucleic acid molecule encoding the antigen precursor
                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for diagnosing a disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 10;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 26; DB 22; Length 10

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents a pentapeptide ligand selected according to 2 (15-10) fractional factorial design +3 cp (or 1 cp 2 random), which were used to model the interaction of a ligand with its target. The invention relates to characterising the interaction between a Ligand variety and a Target X by obtaining information (e.g Multivariate Quantitative Structure Activity relationships, MGSAR) representing one or more physical and/or chemical properties of targets of type X and type Y co produce a model of interaction. The methods of the invention are useful for identifying outliers of type X or outliers to produce a model of interaction. The methods of type Y with design of Light and/or selectivity for targets of type X, protein phy high throughput screening, HTS), design of ligands of type Y, with improved affinity and/or selectivity for targets of type X, protein conjinearing, design of organic compound, catalysis and/or in the conjinearing of regions and/or parts of targets of type X and/or ligands of type Y, design of organic compound, catalyst, pharmaceutical, drug, of type Y, design of organic compound, catalyst, pharmaceutical, drug, protein, enzyme, antibody, molecule, macromolecule, peptidomemetic, protein, enzyme, antibody, molecule, macromolecule, DNA, RNA or a carbohydrate. The methods are also useful for designing new ligands for known targets and/or for new targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heptapeptide ligand; drug design; high throughput screening; HTS; MQSAR; Multivariate Quantitative Structure Activity relationships.
                         A novel method for identifying the interaction site, binding site or active site in a macromolecule, using of informative combinatorial chemistry, informative peptide libraries and Multivariate Quantitative Structure Activity Relationships
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to characterising the interaction between a Ligand Y and a Target X by obtaining information (e.g Multivariate Quantitative Structure Activity relationships, MOSAR) representing one or more physical and/or chemical properties of targets of type X and type Y to produce a model of interaction. The methods of the invention are useful for identifying outliers of type X or outliers of type Y, drug design, design or identification of lead compounds (e.g by high throughput screening, HTS), design of ligands of type Y with improved affinity and/or selectivity for targets of type X, protein engineering, design of DNA or RNA molecules, design of artificial targets

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              07-0CT-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    22-JUN-2000.

                                                                                                                                                              The invention relates to methods of producing cyclic peptides which utilise the trans splicing ability of split inteins to catalyse cyclisation of a peptide from a precursor peptide. The precursor peptide has a target peptide interposed between two portions of a split intein. The interaction of the two portions of the split intein creates a catalytically active intein, and also forces the target peptide into a loop configuration that stabilises the ester isomer of the amino acid at the junction between one of the intein portions and the target peptide. To form a cyclic ester intermediate. The ester isomer of the amino acid at form a cyclic ester intermediate. The active intein catalyses the commation of an aminosuccinimide that liberates a cyclised form of the target peptide, which spontaneously rearranges to form the terrapt peptide, which spontaneously rearranges to form the creater peptide, which spontaneously rearranges to form the creative peptide flanked by the two portions of the split intein), also discloses nucleic acids encoding the precursor peptide (i.e. the cyclised peptide product or a splicing intermediate thereof (e.g., a thicester or a lariat intermediate), methods of generating peptide cyclised peptides or a splicing intermediates. The methods can be used for screening the cyclic peptides, for identifying molecules that bind to the target peptides and cyclic peptides. The methods can be used for screening the cyclic peptides, to detect the presence of a predetermined characteristic in a peptide ce.g., the ability to specifically bind a target molecule. The present sequence represents cyclic pseudostalarin F which was generated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                  Non-naturally occurring nucleic acid molecule encodes a target peptide produced in a host system in a cyclized form or as a splicing intermediate of the cyclized form -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Split intein, peptide cyclisation; trans splicing; peptide library; peptide screening; cyclic ester intermediate; Ssp DnaE C-intein; plasmid pARCP-p; plasmid pARCBD-p; pseudostellarin F.

The invention relates to methods of producing cyclic peptides which

utilise the trains splicing ability of split inteins to catalyse

cyclisation of a peptide from a precursor peptide. The precursor peptide

thas a target peptide interposed between two portions of a split intein.

The interaction of the two portions of the split intein creates a

catalytically active intein, and also forces the target peptide into a

configuration that stabilises the ester isomer of the amino acid at

the junction between one of the intein portions and the target peptide.

A heteroatom from the other intein portion then reacts with the ester to

configuration of an aminosuccinimide that liberates a cyclised form of the

target peptide, which spontaneously rearranges to form the

ctarget peptide, which spontaneously rearranges to form the

thermodynamically favoured backbone cyclic peptide product. The

curvention also discloses nucleic acids encoding the precursor peptide

(i.e. the target peptide flanked by the two portions of the split

intein), expression vectors and host cells comprising the nucleic acid,

the cyclised peptide product or a splicing intermediate thereof (e.g., a

thloester or a lariat intermediate), methods of generating peptide

continees and methods of screening peptides and peptide

contines, and methods of screening peptides and peptides

contines, and methods of screening peptides and peptides

contines, and methods of screening peptides and peptide

contines of the presence of a predetermined characteristic in a peptide

contines or peptide read predetermined characteristic in a peptide

contines or predetermined the presence of a predetermined characteristic in a peptide

                                                                                                                                                                                                                                         AAW12680-90 are peptide antagonists of the human urokinase-type plasminogen activator receptor (huPAR) and are used to treat disorders involving huPA, especially metastasis, inappropriate angiogenesis, chronic inflammation, Kaposi's sarcoma; diabetic retinopathy and rhematoid arthritis. They may also inhibit proliferation of huPA-activated tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                 New peptide antagonists of huPAR - useful for treating uPA-mediated diseases, e.g. chronic inflammation or metastasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human metalloproteinase-disintegrin protein with thrombospondin domain - useful as leukocyte and thrombocyte decreasing and egythrocyte increasing agent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents an antagonist of the invention, and targets human urokinase-type plasminogen activator (huPA) receptor. The antagonists are used for treating huPA-mediated disorders, such as metastasis, inappropriate angiogenesis e.g. Kaposi's sarcoma and diabetic retinopathy and chronic inflammation e.g. rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antagonist; urokinase-type plasminogen activator receptor; human; huPA receptor; huPA-mediated disorder; metastasis; Kaposi's sarcoma; inappropriate angiogenesis; diabetic retinopathy; chronic inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptides are urokinase-type plasminogen activator receptor (uPAR) antagonists useful for treating urokinase-type plasminogen activator-mediated diseases such as metastasis and inappropriate

important for antibody recognition. These structures include the A and B domains as well as scattered hydrophilic sequences. Domain B encompasses a consensus binding sequence of 8 amino acids that is necessary and sufficient for binding to UI RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ribonucleo- protein (snRNP) complex and is immunologically homologous to the HIV-1 envelope glycoprotein, gpl20/41. The 70K autoantigen can be used for diagnosing HIV-1 infection in a subject by identifying the presence of anti-HIV-1 antibodies that react with it. The 70K autoantigen has a relatively hydrophobic amino terminus and a hydrophilic carboxy terminus. Three structures within the 70K autoantigen are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAR82609-28 are regions of the 70K autoantigen that are immunologically homologous to HIV-1 regions with the major neutralising epitopes of gpl20/41. The 70K autoantigen is part of the UI small nuclear
                                                                         70K autoantigen; Ul small nuclear ribonucleoprotein; snRNP; HIV-1; Human immunodeficiency virus type 1; infection; anti-HIV antibody; diagnosis; neutralising epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    70k auto:antigen immunologically homologous to {\tt HIV}{-1} - useful for diagnosis and therapeutic treatment of {\tt HIV}{-1} in a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human insulin analogue construction synthetic octapeptide #15.
                                       70K autoantigen peptide immunologically homologous to HIV-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 24; DB 16; Length 8;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          previous immunological analyses of the V3 loop of HIV-1 (AAR62159) have localised the main neutralising domains. The target of more than 80% of neutralising antibodies in HIV-1 infected sera from AIDS patients has now been found to overly the consensus binding sequence and domain A epitopes of the U1 snRNP 70% protein. In AIDS, antibody Litres are too low to arrest the disease, however, the homologous sequences in 70% are immunodominant targets of autoantibodies in the systemic rheumatoid disorder of mixed connective tissue disease. The liters of such autoantibodies exceed HIV-1 epitopes and are useful for treating HIV infection.
                                                                                                                                                                                                                                                                                                                epitope; autoantibody; immunoinfective cluster virus; nuclear protein antigen; systemic rheumatic disorder; human immunodeficiency virus; HIV-1; systemic lupus erythematosus; mixed connective tissue disease; scleroderma; glycoprotein 120.

The present invention describes analogues of human insulin modified at position 29 of the B chain, and optionally at other positions. The insulin analogues have modified physico-chemical and pharmacokinetic properties and are useful in the treatment of hyperglycaemia. They are less prone to dimerisation or self-association to higher molecular weight forms and so possess a comparatively more trapid onset of activity while retaining the biological activity of native human insulin. The present sequence represents a synthetic octapeptide used in the preparation of human insulin analogues in an example from the present invention.
                                                                                                                                                                                                                                                        New insulin analogues modified at B-chain position 28 - showing reduced self-association and more rapid onset of activity, used for
                                                                                                                                                                                              Frank BH, Shields JE;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 11,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 2, Application US/08800213A
Patent No. 6030940
GENERAL INFORMATION:
APPLICANT: Steven Rosenberg, Kerry L. Spear, Robert Valerio, APPLICANT: and Andrew Bray
TITLE OF INVENTION: Peptide Analog Inhibitors of Urokinase TITLE OF INVENTION: Receptor Activity
NUMBER OF SEQUENCES: 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 9;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Indels

hypothetical protein 29a - Odontella sinensis chloroplast
C;Species: chloroplast Odontella sinensis
C;Date: 17-Feb-1998 #sequence\_revision 26-Feb-1998 #text\_change 24-Apr-1998
C;Accession: S78310
B;Kowallik, K.V.; Stoebe, B.; Schaffran, I.; Kroth-Pancic, P.; Freier, U.
Plant Mol. Biol. Rep. 13, 336-342, 1995
A;Title: The Chloroplast Genome of a chlorophyll a+c- containing Alga, Odontella sine
A;Reference number: S7838
A;Accession: S78310
A;Status: preliminary; nucleic acid sequence not shown; translation not shown
A;Residues: 1-29 <KOW>
A;Rooss-references: EMBL: Z67753; NID: 91185127; PID: e211861; PID: 91185200
A;Note: the nucleotide sequence was submitted to the EMBL Data Library, November 1995
